V yielded 0.5 g. HCOOH, and 5 g. α,β -dipropylpropionic acid, b.p. 240-2[°], n_D^{20} 1.4338. $\text{CH}_3\text{CHCOCH}_2\text{CH}_2$ (**VI**) b.p. 130-7[°], n_D^{20} 1.4811; and a flask residue of 4.0 g. of polyglycolic ethers of **III**. A similar run where 50 g. of **I** was used yielded 40 g. unchanged **III**, 50 g. **IV** and 15 g. **V**. IV b.p. 80-1[°], n_D^{20} 1.4810, d_4^{20} 0.953, *MR* found 157, calcd. 154. **V** b.p. 103-4[°], n_D^{20} 1.4810, d_4^{20} 0.952, *MR* found 197, calcd. 198. *The action of I on $\text{CH}_3\text{CH}=\text{CC(OH)Me}_2$ (VII).* (a) 1 (0.8 g.) was added to **VI** which was prep'd. by the condensation of 90 g. $\text{CH}_3\text{CHC}_2\text{CH}_2$ with 110 g. MeCOEt in 120 cc. of ether, in the presence of 50 g. **II**. The molar ratio of **VI** and **I** was 1:1 and the reaction conditions the same as before. The following fractions were obtained: 80 g. of unchanged **VI**, 65 g. of monoglycolic ether (**VIII**) of **VI**, 30 g. diglycolic ether (**VII**), 21 g. flask residue of polyglycolic ethers (**IX**). (b) To 45 g. of **II** and 70 cc. of ether was added 110 g. freshly distd. **VI** b.p. 58[°], n_D^{20} 1.4901. To the resulting mix. was added 51 g. **I**. The molar ratio of **VI** and **I** was 1:1.5. On careful vacuum-distn. the following fractions were obtained: 30 g. of unchanged **VI**, 60 g. **VII**, 38 g. **VIII** and 18 g. **IX**. *Reaction of I with $\text{CH}_3\text{CH}=\text{CC(OH)Me}_2$ (III).* In a 3-neck flask equipped with a mech. stirrer, a thermometer, a dropping funnel and a g. reflux condenser were placed 60 g. **II** and 100 cc. dry ether. A mixt. of 60 g. $\text{CH}_3\text{CHC}_2\text{CH}_2$ and 60 g. of acetone was gradually added to **I** while stirring constantly and cooling with ice water. The reaction mass was stirred for 5 hrs. at room temp. after all the mixt. had been added. To the mixt. **III** was added dropwise 70 g. **I** in 80 cc. of dry hrs., while stirring vigorously, and 5 g. of a diene hydro-ether. A small rise of temp. (20-30[°]) was noted during the carbon (b.p. 39-40[°], n_D^{20} 1.5029) formed by the dehydration addn. of **I**. After all of **I** was added the mixt. was stirred of **VI** also sepd. in this run. **VIII** b.p. 125-7[°], n_D^{20} 1.4902, and the next morning the alkali was washed off with $\text{CH}_3\text{CHC}_2\text{CH}_2$ (**X**). 1 (18 g.) was added to water, the product was neutralized with dil. AcOH, dried **X**, which was obtained by the condensation of 60 g. vinyl-ether anhyd. NaSO₄ and carefully vacuum-distd. The acetylene and 90 g. MeCOPr in the presence of 50 g. **II** following fractions were obtained: 25 g. of unchanged and 100 cc. of ether. The reaction products were 85 g. **III**, b.p. 45-7[°], n_D^{20} 1.4710; 45 g. monoglycolic ether (**IV**) unchanged **X**, 41 g. monoglycolic ether (**XI**) of **X**, 30 g.

diglycolic ether (**XII**), and 5 g. residue. By the action of and its acetate); 21 g. of **XIX**. Similar results were obtained 20 g. of I and 85 g. of freshly distd. **X**, in 100 cc. of ether in the presence of 35 g. of II, were obtained 25 g. of unchanged on acetylation with AcOH contg. H₃PO₄, **XIX**, b, 92-3°, **XI**, 33 g. of **XI**, and 18 g. of **XII**, **X**, b, 65-6°, n_D²⁰ 1.4780, d₄²⁰ 0.9377, MR found 200, calcd. 198. *Hydroly-* **XI**, b, 96-7°, n_D²⁰ 1.4780, d₄²⁰ 0.9388, MR found 201, calcd. 198. *Hydroly-* **XII**, b, 65-6°, n_D²⁰ 1.4780, d₄²⁰ 0.9377, MR found 229, calcd. 226. *Action of I on CH₃CH₂CC(OH)P₂*: It yielded 8 g. of **XII** and 15 g. of a mixt. of **XII** and glycol (**XIII**, I (70 g.) was added to **XIII**, which was formed by the condensation of 90 g. of I and 172 g. Pr₂CO in 150 cc. of ether in the presence of 80 g. of II. It yielded 105 g. with 2 vols. of H₂O. The top layer was extd. with ether, unchanged **XIII**, 98 g., monoglycolic ether (**XIV**) of **XIII**, 47 g., diglycolic ether (**V**) and a flask residue of 60 g. The same results were obtained by the action of molar proportions of I and freshly distd. **XIII** in the presence of II. **XIII**, b, 83°, n_D²⁰ 1.4760, d₄²⁰ 0.8784, MR found 100, calcd. 100. **XIV**, b, 108-9°, n_D²⁰ 1.4780, d₄²⁰ 0.9230, MR found 211, calcd. 210. **V**, b, 110-2°, n_D²⁰ 1.4781, d₄²⁰ 0.9564, MR found 261, calcd. 254. *Action of I on CH₂CH₂CH₂CH₂CH₂CH₂(OH)C(=O)CH₂CH₂CH₂* (**XVI**): 80 g. of I was added to **XVI**, formed by the condensation of 90 g. of vinylacetylene with 150 g. of cyclohexanone, in the presence of 80 g. of II in 100 cc. of ether. The products obtained were: 114 g. unchanged **XVI**, b, 79-80°, n_D²⁰ 1.5170; 80 g. of monoglycolic ether (**XVII**) of **XVI**; 40 g. diglycolic ether (**XVIII**); and a flask residue of 23 g. **XVIII**, b, 118-19°, n_D²⁰ 1.5092, d₄²⁰ 1.0088, MR found 197, calcd. 194. **XVIII**, b, 140-50°, n_D²⁰ 1.5052, d₄²⁰ 1.0031, MR found 230, calcd. 238. *Esterification of 2-hydroxyethyl ethers of vinylacetylenyl carbonyls with org. acids.*: CH₃CH₂CCMe₂OCH₂CH₂OAc (**XIX**), CH₃CH₂CCMe₂OCH₂CH₂OH (**XX**) (40 g.), b, 84-5°, was mixed with 120 g. glacial AcOH contg. 2 g. HCl. The temp. rose from 10° to 30°. The mixt. was stirred for 4 hrs. at room temp. and 1 hr. at 35-40°. The residual AcOH was then neutralized with soda, the substance dried and carefully vacuum-distd. The yield was 1 g. CH₃CH₂CH₂CCMe₂CH₂Cl (**XII**), b, 39-40°, n_D²⁰ 1.4800; 18 g. of unchanged **XX** (with an admixt. of glycol was washed with H₂O, dried with K₂CO₃ and vacuum-distd. was washed with H₂O, dried with K₂CO₃ and vacuum-distd. was washed once more with H₂O, dried and vacuum-distd. The yield was 14 g. of **XX**, b, 81-3°, n_D²⁰ 1.4812. *Methanolysis* of **XX** (30 g.) and 60 g. of MeOH contg. 3 g. concd. H₂SO₄ were heated for 1 hrs. at 60-65°, with const. stirring. After dig. with H₂O, the top layer was extd. with ether, washed with soda soln., dried and vacuum-distd. The yield was 10 g. of CH₃CH₂CC(CMe₂)₂OCH₂CH₂Cl, b, 131-3°, n_D²⁰ 1.4530. *CH₃CH₂CCMe₂OCH₂CH₂OCH₂Cl* (**XIII**) (dimethyltritylvinylidene phthalimidopropyl ether): XX (200 g.), 110 g. of EtCO₂H and 20 cc. H₃PO₄ (d, 1.5) were placed in a flask equipped with an exhaust steam dephlegmator. The mixt. was heated at 60-70° for 8 hrs. under a vacuum of 20-30 mm. so that the water formed distd. and collected in the receiver. Six g. of vinylisopropenylacetylene, b, 21-5°, n_D²⁰ 1.5500, were recovered from the receiver after neutralizing the EtCO₂H and separated from the aq. layer. The flask residue was neutralized with soda, dried and carefully vacuum-distd. It yielded 98 g. of a mixt. of **XX** and the products of hydrolysis, b, 80-92°, n_D²⁰ 1.4565; 70 g. of **XIII**, b, 102-4°, n_D²⁰ 1.4678, d₄²⁰ 0.9666, MR found 209, calcd. 210. *CH₃CH₂CCMe₂OCH₂CH₂OCH₂Pr* (dimethyltritylvinylidene phthalimidobutyryloxyethyl ether) (**XXIII**): XX (250 g.), 250 g. PrCO₂H and 20 cc. H₃PO₄ were heated at 65-70° for 7 hrs. while stirring constantly. The mixt. was then transferred to a flask with a dephlegmator and heated for 5 hrs. at 65-70° under 20-30 mm. so that the water formed gradually distd. over and was collected in the receiver. A small amt. of vinylisopropenyl-

TITLE: A fuel feeding system of an internal combustion engine. Class 46, No. 189249

SOURCE: Izobretoniya, promyshlennyye obraztzy, tovarnyye znaki, no. 23, 1966, 108

TOPIC TAGS: engine fuel pump, internal combustion engine, engine fuel system

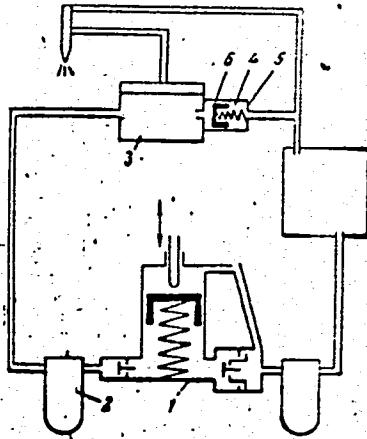

ABSTRACT: This Author Certificate presents a fuel feeding system of an internal combustion engine. The system includes a fuel pump with a suction bypass. This pump feeds fuel through a fine filter and along a tube to a high pressure pump (see Fig. 1). To maintain a constant fuel pressure in filling the pump and to lower the flow of fuel through the filter, a damper is installed in front of the high pressure pump plunger couples. This damper has the form of a cylinder with a spring-loaded piston.

TITLE: Relief-capacitance technique of measuring the intensity of ultrasound

PERIODICAL: Akusticheskiy zhurnal, v. 8, no. 4, 1962, 415-419

TEXT: A possibility of measuring the intensity of ultrasound is discussed. The pressure of ultrasound and some minor factors will produce a relief on the free surface of a liquid or on the interface between two immiscible liquids. The height of this relief depends monotonically on the intensity of the ultrasound. The free surface or interface can therefore be used as one electrode of a measurement cell serving as a capacitor, the capacitance changing with the height of the relief. It was verified in experiments that the height of the relief is directly proportional to the intensity of the ultrasound. The error does not exceed 15-20%. Measurements with the relief-capacitance technique, in which a plane electrode was placed above the free surface of the liquid, showed that at high intensities the relief height increases more slowly than expected in proportion to the intensity.

Card 1/2

Relief-capacitance technique of...

S/046/62/008/004/003/017
B108/B186

This is due to a higher absorption resulting from the distortion of the shape of the wave. Capacitor cells with two liquids are more suitable for intensity measurements, since the reflected ultrasound does not interfere as much as in free-surface-liquid cells. There are 8 figures.

TITLE: Photoelectric properties of cadmium antimonide

SOURCE: Ukrayins'kyy fizichnyy zhurnal, v. 11, no. 5, 1966, 572-574

TOPIC TAGS: photosensitivity, photoelectric property, cadmium compound, antimonide, photoconductivity, crystal, tellurium, crystal impurity, photoresistance, absorption coefficient, absorption edge, minority carrier, carrier lifetime, temperature dependence

ABSTRACT: The photoelectric properties of N-type CdSb crystals with Te impurities were investigated because the subject has been inadequately researched. The experimental results show that 1) the photoconductivity of the crystals at temperatures from 77 to 130 K is monopolar and the nonequilibrium carriers have substantially different lifetimes, 2) the lifetime of the nonequilibrium holes does not exceed 10^{-7} sec, 3) the temperature dependence of the electron lifetime, the drastic decrease in the electron lifetime with illumination from the self-excitation region, and the

Card 1/2

L 33755-66

ACC NR: AP6016054

saturation of the lux-ampere characteristics with increase in illuminance indicate an adherence of minority carriers, 4) the photoconductivity spectrum shifts to the long-wave side and the photocurrent abruptly increases with decrease in temperature, and 5) the temperature dependence of the absorption coefficient indicates that the absorption edge shifts to the short-wave side during the cooling of the crystal. These results practically agree with those obtained by M. Zavetova (Chekh. fizichn. zh., 14, 615, 1964). The authors thank G. G. Tsybuli for carrying out the measurements. Orig. art. has: 2 figures.

TITLE: Some features of the kinetics of photoconductivity of inhomogeneous semiconductors

SOURCE: Ukrayins'kyi fizichnyi zhurnal, v. 10, no. 4, 1965, 459-461

TOPIC TAGS: semiconductor, resistivity, germanium, volume photoemf, photoconductivity, semiconductor resistivity distribution

ABSTRACT: The kinetics of photoconductivity of n-type germanium doped with antimony, in which the specific resistivity is not uniform over the volume of the sample, was analyzed with an aim at measuring the distribution of the resistivity along the sample by determining the degree of motion of minority carriers from the low-resistivity sections to high-resistivity sections (and vice-versa) under the influence of applied short pulses of light. The apparatus was described by one of the authors elsewhere (Romanov, with I. P. Zhad'ko and O. M. Koshelev, Ukr. fizichn. zh. v. 8, 1092, 1963). A typical result is shown in Fig. 1 of the Enclosure. It was obtained by illuminating a sample with a narrow modulated light probe (0.7 mm

Card 1/3

J. 51440-65

ACCESSION NR: AP5011073

3

probe width, duration of square wave pulse $8 \mu\text{sec}$, $\lambda = 1.5 \mu$, lifetime $\tau = 50 \mu\text{sec}$). The effect is more strongly pronounced if strongly absorbed radiation is used. The effect can be especially pronounced in the case of material with resistivity larger than germanium, such as silicon, cadmium sulfide, etc. "The authors thank Academician of AN UkrSSR V. Ye. Lashkar'ov (V. Ye. Lashkarev) and M. K. Sheynman for a discussion of the work." Orig. art. has: 2 figures.

TITLE: Change in the probability of the Mossbauer effect on Sn^{119} impurity nuclei in
the ferroelectric phase transition in BaTiO_3 . 19

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu
(Prilozheniya), v. 2, no. 4, 1965, 186-189

TOPIC TAGS: Mossbauer effect, ferroelectric effect, phase transition, barium titanate,
impurity center, tin containing alloy.

ABSTRACT: This is a continuation of earlier work (FTT v. 7, 1886, 1965), where it was
assumed that the phase transition in solid solutions of the $\text{Ba}(\text{Ti}_{0.8}\text{Sn}_{0.2})\text{O}_3$ system is
considerably spread out. In the present study, the authors have investigated the pro-
bability of the Mossbauer effect on Sn^{119} impurity nuclei in the $\text{Ba}(\text{Ti}_{0.99}\text{Sn}_{0.01})\text{O}_3$
system near the ferroelectric phase-transition temperature. The introduction of so
small an amount of tin impurity into barium titanate does not change its ferroelectric
properties noticeably, but at the same time makes it possible to measure the resonance
absorption of 23.8-kev γ quanta by the Sn^{119} impurity nuclei. The samples were pre-
pared by standard ceramic technology, using tin oxide enriched with Sn^{119} to 65.1%.
The measurements were made with a setup in which the absorber was driven at constant

9

speed by means of a mechanical cam drive. The γ -quantum source was magnesium stannide ~18 mg/cm² thick. Measurements were made of the temperature dependence of the relative Mossbauer-effect probability (1), of the dielectric constant (2), and of the dielectric loss tangent (3) for the system Ba(Ti_{0.99}Sn_{0.01})O₃ (Fig. 1). The relative probability of the effect was determined from the ratio of the areas of the absorption spectra at the given temperature to the area of the spectrum at the Curie temperature, the value of which ($T_C = 390K$) was chosen to correspond to the maximum of the dielectric constant. It is seen from the figure that the relative Mossbauer-effect probability decreases quite sharply on approaching the Curie point from the paraelectric region, passes through a minimum, and then begins to grow with decrease in temperature in the usual manner. This singularity can be attributed to the temperature dependence of the frequency of the anomalous optical branch. A comparison of the results with earlier measurements (Bokov, Romanov, and Chekin, FTT v. 7, 1886, 1965) confirms the previously advanced hypothesis that the phase transition in solid solutions of the Ba(Ti_{0.8}Sn_{0.2})O₃ system is considerably "smeared." Authors thank Professor G. A. Smolenskiy for continuous interest in the work, Candidate of Technical Sciences I. E. Myl'nikov for preparing the samples, and L. I. Kazakevich for help with the measurements. Orig. art. has: 1 figure.

AUTHOR: Romanov, V. P.

TITLE: Use of two-dimensional image filtration for increasing the reliability of automatic reading. Part II. Investigation of a model of a reading automaton on a digital computer

SOURCE: Nauchno-tehnicheskaya informatsiya, no. 7, 1964, 26-29

TOPIC TAGS: reading automaton, pattern recognition^{b6c}, character recognition, image filtration, computer programming

ABSTRACT: The author describes the model of an optimal system for a reading automaton, as well as the results of experiments and actual runs made on the Ural-4 computer. The model for distinguishing alphabetical, numerical and punctuation characters is organized along the following lines: (1) Reorganization of the image into discrete electrical signals; (2) Recognition of defects in the picture and their correction; (3) Character Recognition; (4) Comparison of an unknown character with a standard character; (5) Coding of a recognized character in the output code and the recognition of the result. The author states that only points (2) through (5) were utilized in the model. All letters of the Russian and Latin

Card 1/3

L 32432-65

ACCESSION NR: AP5000880

alphabets, as well as the ten numerals and the major punctuation marks, are stored in the machine. Letters traced on perforated cards are used as standard characters are stored in the machine's memory for later comparison by means of programmed signals. Filtering is used to remove "noise" around a character in a given field. The author also deals with the problem of centering characters and cites the difficulties of some earlier methods in terms of establishing the identity of a character and the search time involved. The current problem in the modeling of a reading automaton is to combine or coordinate the center of a field of 39 x 39 points with the actual center of a character. Coordinates for the center of a character are determined by two formulas which are presented and explained in the paper. After being filtered and centered, each character is scanned, and a comparison is made with the standard stored in the computer's memory, for a coincidence check. Following this, a program operates which results in the writing of a corresponding character. Two drawings are presented in the paper which represent the output of the URAL-4 digital computer, used as a reading automaton. In the model, the output of a character was written out by the URAL-4 by means of points superimposed on a background of zeroes. Two tables are presented in the article to provide some idea of the distance between letters

Card 2/3

L 32432-65

ACCESSION NR: AP5000880

that are similarly shaped, in the Russian as well as the Latin alphabets. The author also points out that because of insufficient storage in the URAL-4, it is not possible to utilize, within the computer, all of the standards for all of the letters at one time. It is an interesting fact that the distances between several letters usually considered similar are unexpectedly great, Z and F of the Latin alphabet being one of several noteworthy examples. The program for verifying characters in terms of the standard stored in the computer memory consists of more than 1,000 instructions. The time for the recognition of one character on the URAL-4 computer is three minutes. Orig. art. has: 2 figures, 2 tables and 2 formulas.

AUTHOR: Romanov, V. P.

TITLE: Use of two-dimensional image filtration for increasing the reliability of automatic reading. Part. I. Experiments in the processing and writing of machine-written characters by digital computer

SOURCE: Nauchno-tehnicheskaya informatsiya, no. 7, 1964, 24-26

TOPIC TAGS: character recognition, pattern recognition, digital computer, reading automaton, image filtration

ABSTRACT: The author discusses the formation of generation of the letters and numerals of the Latin alphabet in a 32×32 point raster, totalling 1024 points, by means of electron-beam tubes and a photomultiplier. A video signal is discriminated according to one of two levels, one corresponding to the impinging of an electron beam on a black field and the other, to a white field. A signal or pulse to the black field corresponds to a 1, while a signal to the white field corresponds to a zero. As characters are formed or generated, they are introduced into the new Soviet high-speed digital computer, URAL-4. The author points out that the objectives of the experiments discussed in this paper centered around increasing the reliability of an automatic reading device by increasing

Card 1/3

L 32434-65

ACCESSION NR: AP500879

its ability to discriminate between characters. The method used consisted of five steps: (1) A smoothing or averaging operation; (2) Differentiation of a character; (3) Isolation of the straight portions of a character; (4) Isolation of the curved portions of a character; (5) Isolation of the special points of a character. The author is especially interested in the possible application of models of neural networks to the problem of automatic character recognition. Two approaches to the problem were investigated, differing from one another in terms of weights assigned and in the size of the area used (the latter in terms of points). A very important factor in the entire process of improving the reliability of a reading automaton is the isolation of the elements of a given character. Thus, research into algorithms for the isolation of such elements makes it possible to: (1) Isolate the straight-line elements of complex characters; (2) Isolate the contours of an image into special points, coincident with its differentiation. The URAL-4 computer program for analyzing an image in an aperture containing 3×3 points, consists of 200 instructions and has a running time of 65 seconds. A similar program, based on 5×5 points, involves 300 instructions and 145 seconds running time. The author devotes considerable discussion to the isolation of curved elements, which is the most complex function of the proposed reading automaton. Although the experiments he conducted assured the

Card 2/3

L 32434-65
ACCESSION NR: AP500879

possibility of isolating the curved sections of a character, the number of operations involved was quite large, and it would take, at present, some 8 minutes to process one character. The author concludes by saying that the algorithms described in his paper can be applied to the construction of a reading automaton, and that the realization of such a device can come about with the assistance of some type of neuronal design. "The author acknowledges the work of Engineer V. V. Mozolevsky in connection with the algorithm development and the actual experiments with the reading automaton." AUTHOR: Romanov, V. P.

TITLE: Extraction of informational invariant characters by a reading automaton

SOURCE: Nauchno-tehnicheskaya informatsiya, no. 2, 1964, 34-38

TOPIC TAGS: character recognition, pattern recognition, information theory, reading automaton, reading algorithm

160

ABSTRACT: This article is concerned with the process of forming a system of letters and characters, and stresses the importance of this function in a reading automaton; at the present time, there are no absolute rules for the choice of such letters and characters. The article attempts to describe such characters mathematically and to formulate a basis for their selection by a reading automaton. The steps taken by a reading automaton are described as follows: (1) Transformation of a letter, or character, into an electric signal; (2) Discrete and optimal filtration of noise; (3) Isolation of characters; (4) The formulation of a conclusion on the basis of the given characters. This article is concerned mainly with the third step enumerated above, namely, the isolation of characters. The author shows how this can be done by means of a geometric representation of char-

Card 1/2

L 27612-65

ACCESSION NR: AP5000873

acters which describe letters in the reading automaton as components of a multi-scale vector. This particular theory is expanded in the discussion of character abstraction as the calculation of a linear function, and the calculation of invariant characters by means of logical analysis of the character's contour utilizing the methods of integral geometry. The article concludes with an algorithm for the extraction of characters. Orig. art. has: 1 figure and 37 formulas.

TITLE: Mossbauer effect in the ferroelectric $Pb(Fe_{1/2}Nb_{1/2})O_3$

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.
Prilozheniya, v. 3, no. 5, 1966, 212-216

TOPIC TAGS: ferroelectric material, Mossbauer spectrum, multiplet splitting, critical point, phase transition, Curie point, electron spin

ABSTRACT: The purpose of the investigation was to check on the presence of a minimum of the probability of the Mossbauer effect on Sn^{119} in the investigated compound, similar to that observed for $Ba(TiSn)_O_3$ (with different Ti/Sn ratios) by V. A. Bokov et al. (FTT v. 7, 1886, 1965 and elsewhere). It was also desired to check on other singularities in the behavior of the quadrupole splitting and of the position of the symmetry center of the Mossbauer spectrum observed near the temperature T_c of the ferroelectric phase transition. To this end, the authors investigated the variation of the parameter of the Mossbauer absorption spectrum of Fe^{57} nuclei of the ferroelectric in question at the phase transition temperature ($T_c = 114^\circ C$). The absorbers were made by the usual ceramic technology, using Fe_2O_3 (60% Fe^{57}). The source was Co^{57} in stainless steel. The apparatus for the Mossbauer spectra is described by the authors elsewhere (PTE No. 4, 43, 1964). The results confirm the existence of the

Card 1/2

L 24372-66

ACC NR: AP6010437

10

singularities in the vicinity of the Curie point $T_c = 214^\circ C$ and a minimum in the Mossbauer-effect probability. These singularities are apparently connected with the fact that an anomalous decrease in the frequency of one of the transverse optical branches of the lattice takes place on approaching the ferroelectric transition point in crystals with perovskite structure. The decrease in the quadrupole splitting with increase of temperature to T_c is connected with a decrease in the spontaneous polarization. The asymmetry of the quadrupole-splitting line, which has a minimum near T_c and reverses sign, can be due either to anisotropy of the Mossbauer-effect probability or to relaxation of the electron spins in a ferromagnet. It is concluded that an investigation of the temperature variation of the asymmetry can give important information on the dynamics of the realignment of the crystal structure during the ferroelectric transition. The authors thank F. Ye. Chukreyev and V. I. Man'ko for the computer programming, Yu. M. Kagan, A. M. Afanas'yev, B. N. Samoilov, and B. I. Verkin for discussions, K. P. ABSTRACT: A grid of 32 rows and 32 columns is imposed on representations of machine writing of letters and figures of the Latin alphabet. If in some cell of this grid there is a representation, then a one is put in it, otherwise a zero is put there. Such discrete representations of letters and figures were introduced into the computer Ural-4. Distortions were imposed on these representations, of the type where a sign is reversed at 50 or 100 points, or a gap is set in every other row or every fourth column. The author studied various means of working out distortions of representations with the aim of restoring the original representation. He was able to make use of summation with certain weights of neighboring points of a table, of separation of straight-line and curvilinear parts of a representation, and end and node points. Further, the center of gravity of the worked-out representation was combined with the

UDC: 519.281

Card 1/2

I. 45395-66
ACC NR: AR6015989

centers of gravity of the standard representations, and for this representation the author computed the mean square deviation from the standard ones. For the value of a representation he used the value of the closest of the standard ones. The procedure for working out the distorted representation until its recognition on the Ural-4 takes 3 minutes. According to the author, the principles employed can be used as the bases of projection of a real reading automation. V. Kolchin. Translation of abstract

TITLE: Pattern recognition system based on analyzing the directions of local sections of the pattern

SOURCE: AN SSSR. Izvestiya. Tekhnicheskaya kinernetika, no. 6, 1966, 123-129

TOPIC TAGS: pattern recognition, ~~theoretical~~ mechanics, inertia ellipse, direction field

ABSTRACT:

A method of analyzing the patterns and directions of local sections and a method of pattern recognition based on these analyses are presented. The author shows how the direction of the local section is determined, and a pattern recognition system which utilizes not only the brightness field but also the field of directions can be constructed. The ideas of theoretical mechanics are used to determine the directions of local sections of patterns.

TOPIC TAGS: optic scanning, data readout, computer output unit

ABSTRACT: The proposed scanning unit of an automatic reading device contains an image-into-electric-signal conversion system. To increase the reliability of image perception, the following elements are used: a two-dimensional filter containing a shift register; a video-signal summing d-c amplifier; a reference-signal summing d-c amplifier; and a comparator. The input weighting resistors of the video-signal d-c amplifier are connected with the outputs of the shift register cells, the input weighing resistors of the reference signal d-c amplifier are connected with the source of the reference signal, and outputs of both d-c amplifiers are connected with the inputs of the comparator. TITLE: Using statistical criteria in automatic reading

SOURCE: AN SSSR, Institut nauchnoy informatsii, Chitayushchiye ustroystva (Reading devices).
Moscow, VINITI, 1965, 14-24

TOPIC TAGS: information theory, reading machine, recognition process, light reflection coefficient

ABSTRACT: The author studies the applicability of statistical criteria to the problem of automatic reading. A general diagram is given for an automatic reading machine. A sheet of paper or film serves as information carrier for recognition. The images are characterized by the reflection and transmission coefficients, at every point $M(x, y)$, assuming that the function $g(x, y)$ is given in both cases. The operation of the reading apparatus is represented as a sequence of transformations in the function $g(x, y)$ and output signals D are the result. The output signals correspond to the given letter. An expression is given for calculating the output signals

$$D = GNHQST [g(x, y)]$$

where D are the output signals of the machine and G, N, H, Q, S, T are the operations performed by the respective blocks of the circuit. The physical characteristics and the function of all the blocks are discussed. The solution rule derived from the probability relationships incor-

Card 1/2

L 32829-66

porates all possible permissible letter transformations weighted with the probabilities. For the more general case, the optimal boundary may be determined by similar arguments where the distribution of the matrix T is continuous. An expression is given showing that during permissible transformations, the resulting distribution can be presented as a composition of normal modes where their means and matrix covariations are a function of the transformation of parameter values. TOPIC TAGS: optic image, character recognition, character reading equipment, vector
function, ~~image element~~, track analysis, aerial reconnaissance

ABSTRACT: This is a continuation of earlier work by the author (Nauchno-tekhnicheskaya informatsiya no. 7, 24, 1964), where methods were described for separating straight-line and curvilinear elements of an image with the aid of two-dimensional spatial filters, to permit automatic reading and recognition of images of complicated form. The present article describes the new method of analyzing shapes of images, in which certain ideas of theoretical mechanics are used. The analysis of the image begins with a study of its local structure and spatial orientation of its elementary sections. The index assigned to a given element involves the use of ordinary geometrical recognition methods. The field of the amplitudes (brightnesses) and the field of the directions (phases) is then used in the system for recognition of symbols of the alphabet or numbers. The theory of this recognition method is briefly described. Experiments on Latin and Russian letters, numbers, and certain geometrical figures, using the auto-

Card 1/2

TITLE: Mossbauer effect on Sn¹¹⁹ nuclei in the ferroelectric phase transition in the solid solution Ba(Ti_{0.8}, Sn_{0.2})O₃.

SOURCE: Fizika tverdogo tela, v. 7, no. 6, 1965, 1886-1888

TOPIC TAGS: ferroelectric material, Mossbauer effect, phase transition, Curie point, solid solution, barium compound, titanium containing alloy, tin containing alloy

ABSTRACT: The purpose of the investigation was to check by independent means the correctness of the theory that the spontaneous polarization of crystals with perovskite structure is due to the instability of some transverse normal oscillations of the low-lying optical branch. The use of the Mossbauer effect for this purpose was theoretically described by C. Musikar et al. (Phys. Stat. Sol. v. 3, K9, 1963). The authors investigated the Mossbauer absorption by Sn¹¹⁹ in polycrystalline samples of the solid solution Ba(Ti_{0.8}, Sn_{0.2})O₃, prepared by a usual ceramic technique, using natural tin. The 23.8 keV gamma source was Me₂Sn¹¹⁹.

Card 1/3

L 2508-66

15

with natural emission line width (0.38 ± 0.01) mm/sec. The source was always at liquid-nitrogen temperature. The temperature of the investigated samples varied from 77 to 300K. It is deduced from the anomaly of the temperature dependence of the ratio of resonance absorption probability to the absorption probability at 300K that near the ferroelectric region the frequency of the transverse normal oscillations of one of the optical branches does indeed decrease, but the temperature at which this occurs is lower than the temperature corresponding to the maximum dielectric constant. This difference is attributed to the fact that the phase transition in the investigated solid solution does not occur at a clearly defined temperature, and that the fluctuations of the composition or microinhomogeneities cause different microscopic regions of the crystal to have different Curie temperatures. Another possible cause of the anomaly in the Mossbauer effect is the fact that the mass of the impurity (Sn) exceeds by more than two times the mass of the host (Ti). "The authors thank B. I. Verkin and G. A. Smolenskiy for interest in the work and I. Ye. Myl'nikova for preparing the samples." Orig. art. has: 2 figures.

AUTHOR: Romanov, V. P.

TITLE: Experimental study of the flow in a rotating centrifugal wheel

PERIODICAL: Izvestiya vsshikh uchebnykh zavedeniy. Neft' i gaz, no. 2,
1961, 95-100

TEXT: To study the structure of the flow in the canals of a rotating centrifugal wheel, the institute mentioned under "Association" developed a special experimental arrangement of a centrifugal pump with transparent casing and transparent upper plate of the working wheel of the pump; the device should be able of reproducing the work of the pump with minimum possible deviations from operational conditions, and permit a thorough study of the flow in all canals. The working wheel and the guide were taken from the 3H -95 (EN-95) pump produced in series. The casing of the pump in the form of two cylindrical bodies was made of organic glass and carefully polished. Under normal conditions, the wheel had a speed of 2850 rpm. The liquid was drained through 6 radial canals bored into the casing. The upper plate of the working wheel consisted of organic glass. The device included two mer-

Experimental study of ...

cury manometers, a wattmeter, and a measuring tank. A stroboscope was used for visual observation and to photograph the interaction of wheel blades with the liquid. The device worked satisfactorily at frequencies of up to 1000 cps; a neon tube served as light source. The duration of the discharge and, thus, also the duration of a light flash was, under such conditions, about $5 \cdot 10^{-6}$ sec, and the picture obtained was sharp. Only periodic phenomena could, however, be photographed with the stroboscope. To photograph aperiodic phenomena, it was necessary to use a pulse lamp with a light intensity of some million stilbs and an ignition time of one microsecond. The author used a "Зенит-С" ("Zenit-S") camera at an exposure time of 1-1.5 sec. He used india ink to visualize the motion of the liquid. The picture obtained with a stroboscope is shown in Fig. 3 according to a photograph. The flow was greatly disturbed by a turbulent zone over 2/3 of the blade length on its working side. The difference of the theoretical values for the velocity of the liquid in the canal from the real flow velocity photographed shows that the idea of a constant value of axial turbulence is incorrect at any rate. The cavitation was also photographed; the water was preheated to 28°C, and the cock in the intake duct was partly closed. Cavitation also occurred on the working side of the blade (Fig. 4) in

TITLE: An installation for strength tests of the working wheels in high-speed turbines. Class 42, No. 182913 [announced by the Central Scientific Research Institute of Technology and Machine Building (Tsentral'nyy nauchno-issledovatel'skiy institut tekhnologii i mashinostroyeniya)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 12, 1966, 94.

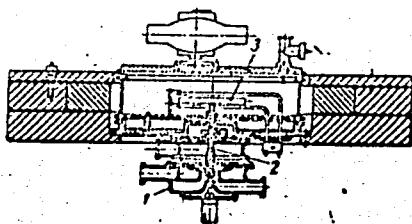

TOPIC TAGS: turbine rotor, test facility

ABSTRACT: This Author's Certificate introduces an installation for strength tests of the working wheels in high-speed turbines. The unit contains a turbine drive, vacuum chamber with cylindrical wall surrounded by an annular jacket, and a device for induction heating of the components being tested. A drive shaft passes through the cylindrical wall of the vacuum chamber for holding the part to be tested. The rotational velocity of the part being tested is increased by making the turbine drive in the form of a centripetal-flow air turbine with the component to be checked mounted on its drive shaft.

TITLE: Evaluation of the bearing capacity of support pillars with underground leaching of thick salt deposits

SOURCE: Leningrad. Gornyy institut. Zapiski, v. 51, no. 1, 1966, 99-104

TOPIC TAGS: mining engineering, stress analysis, photoelasticity, test model, centrifuge, optic model/ BKTs-3 centrifuge

ABSTRACT: This article deals with the problem of obtaining maximum yield from an underground mine chamber, while still leaving sufficient support pillars to allow for safe operation. The particular case in point is the Yar-Bishkadakskiy Salt Mine, and the authors make use of the photoelastic method in studying the distribution of stresses in support pillars. Included in this study are experiments in which various mine chamber plans were made and then contrasted with respect to the magnitudes of stresses occurring in support pillars serving each type of chamber. Four three-dimensional models were prepared from optically active epoxide resins on a 1:5000 scale. The models were centrifugally loaded through the use of a BKTs-3 centrifuge (the centrifuge coefficient reached a value of 210). The tests were set up to permit measurement of various types of stresses and the concentration coefficient at selected

Card 1/2

UDC: 622.838.53

ACC NR: M7004467

sections in the models. The results of the optical modeling were checked with tests performed on perforated paraffin plates. The results of both forms of testing were in close agreement. The authors demonstrate a method by which the bearing capacity may be accurately characterized by a dimensionless test parameter calculated for variants of the mine chamber configuration. Title : On the Relationships Between the Young Growth
and the Mother Trees Stand in Forest Plantings

Orig Pub: Izv. AN BSSR. Ser. biol. n., 1957, No 2, 39-45

Abstract: This study covered the effect of mother trees on the distribution of their offspring on the area under their cover. The study was conducted in Belarusia in 100 to 200-year old gout weed-spruce-hornbeam woods and in the 70-year old pine-birch plantings amid bristly fox-tail grass and green moss.

Card 1/2

It was determined that the self-seeding of the maple occurs chiefly under the spruce-oak canopy. Hornbeam reproduces well under the spruce cover, avoiding the oak tree stands. Spruce self-seeding occurs abundantly under the canopy of deciduous trees (particularly oak). The young oak growth adapts itself to the "windows" in the mother tree stand. In the pine-birch plantings, the birch has a beneficial effect on the propagation of pine, the young growth of which is grouped only under the birch canopy. The reproduction of ash trees is adapted chiefly to the cover of deciduous trees and proceeds feebly under the spruce cover.

TITLE: Working stand of rolling mill. Class 7, No. 173689 [announced by All-Union Scientific Research and Design and Construction Institute of Metallurgical Machinery Construction (Vsesoyuznyy nauchno-issledovatel'skiy i proyektno-konstruktorskiy institut metallurgicheskogo mashinostroyeniya)]

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 16, 1965, 15

TOPIC TAGS: rolling mill, roller adjustment, roller control, METALLURGIC MACHINERY, METALWORKING MACHINE ACCESSORY

ABSTRACT: This Author Certificate presents a working stand of a rolling mill which includes an eccentric compression arrangement and rollers which are shaped for a general part configuration (see Fig. 1). To permit mounting of the rollers at an angle to each other for rolling of unsymmetrical profiles, the pressurizing sections on the left and right sides are made independent of each other but with synchronization of the lower and upper parts of the compression sections.
